Distr: E3d/L2c (1)  
Condensations of polyhydric alcohols and monosaccharides with cyclopentanone and cyclohexanone. V. M. Mirović and A. Stojiljković (Univ. Belgrade, Yugoslavia). *Tetrahedron* 7, 189-200 (1953). — Cyclopentanone (I) and cyclohexanone (II) condense with polyhydric alcohols and monosaccharides to yield di- and tricyclopentylidene and cyclohexylidene derivs. Series of new condensation products were prep'd. and characterized. Glycerol (21 g.), 42 g. I, and 4 drops of 40% H<sub>2</sub>SO<sub>4</sub> stirred 10 hrs. on a steam bath, the cooled mixt. extd. with Et<sub>2</sub>O, the dried ext. dilut. and the fraction, b. 136-58°, treated with 2 vols. satd. aq. NaHSO<sub>3</sub>, the filtered soln. extd. with Et<sub>2</sub>O, and the product dilut. yielded 4 g. *cyclopentylidene-glycol*, b. 163°, [α]<sub>D</sub><sup>25</sup> 1.4537, d<sub>4</sub> 1.024, M.R. 33.82. Glycerol (20 g.), 40 g. I, and 8 g. anhyd. NaHSO<sub>3</sub> stirred 24 hrs. at room temp. with addition of 0.4 g. HCl gas, the mixt. neutralized and filtered, the filtrate distd. in vacuo in the presence of Ag<sub>2</sub>O, the distillate freed from unchanged I, and the residue distd. yielded 41% *cyclopentylidene-glyceral* (III), b.p. 127-9°. Glycerol (10 g.), 20 g. I, and 2 g. 96% H<sub>2</sub>SO<sub>4</sub> occasionally shaken at room temp. 24 hrs., the mixt. neutralized with PbCO<sub>3</sub>, and the filtered soln. dilut. yielded 54% III, b.p. 122-3°, [α]<sub>D</sub><sup>25</sup> 1.4793, d<sub>4</sub> 1.073, M.R. 39.30; *J,S-diisobutyrate*, m. 79°, *β-isomerulofuranose* (IV), m. 38°. IV (3 g.) and 3.7 g. NaI heated 12 hrs. in Me<sub>2</sub>CO in a sealed tube at 100°, the mixt. filtered and the filtrate evapd., the syrup treated with ligroine to remove IV and with Et<sub>2</sub>O to eliminate NaI, and the residue evapd. gave *cyclopentylidene-monosidohydrin*, hydrolyzed with 0.6N AcOH to authentic glycerol iodohydrin, m. 48° (CHCl<sub>3</sub>-ligroine). Pentaacerythritol (3 g.), 11.6 g. I, and 5 drops concd. H<sub>2</sub>SO<sub>4</sub> stirred 3 days at room temp., the mixt. made alk. with KOH, and the product washed with H<sub>2</sub>O yielded 24% *cyclopentylidene-pentaerythritol*, m. 162°

(alc.). Similarly were prep'd. *dicyclopentylidene-monosidohydrin*, m. 84° (80% alc.), and the corresponding *dicyclopentylidene-pentaerythritol*, m. 125° (alc.), and *dicyclopentylidene-mesaerythritol*, m. 95° (alc.), b.p. 60, 87, and 87% yields. 27 May. 5  
Arabitol (1.5 g.), 7 g. I, and 0.26 ml. concd. H<sub>2</sub>SO<sub>4</sub> stirred 1 day at room temp., the neutralized mixt. extd. with Et<sub>2</sub>O, and the H<sub>2</sub>O-washed ext. evapd. gave 0.8 g. *dicyclopentylidene-L-arabitol*; *β-isomerulofuranose*, m. 64° (ligroine). Mannitol (9 g.) and 50 ml. I stirred several hrs. with P<sub>2</sub>O<sub>5</sub> and the neutralized mixt. poured into H<sub>2</sub>O gave 4.8 g. *dicyclopentylidene-D-mannitol*, m. 70° (alc.), [α]<sub>D</sub><sup>25</sup> 11.37° (c 1.25, CHCl<sub>3</sub>). Similarly was prep'd. *tricyclo-pentylidene-D-sorbitol*, m. 75° (alc.), [α]<sub>D</sub><sup>25</sup> 7.5° (c 1.00, alc.). 2 g. L-arabinose, and 15 drops concd. H<sub>2</sub>SO<sub>4</sub>, stirred 24 hrs., the filtered soln. neutralized, dilut. with H<sub>2</sub>O, and extd. with Et<sub>2</sub>O produced 53% *dicyclopentylidene-L-arabinose*, m. 62° (80% alc.). Similarly were prep'd. *dicyclopentylidene-D-xylose*, m. 80° (80% alc.), and *dicyclopentylidene-D-mannose* (V), m. 116° (40% alc.), [α]<sub>D</sub><sup>25</sup> 8.7° (c 1.04, alc.), b.p. 31 and 44% yields. The corresponding *dicyclo-hexylidene-L-arabinose*, m. 85° (70% alc.), *dicyclohexylidene-D-xylose*, m. 104° (80% alc.), and *dicyclohexylidene-D-mannose*, m. 122° were prep'd. analogously in 79, 72, and 82% yields. V (1 g.) in 10 ml. H<sub>2</sub>O contg. 0.18 g. KOH stirred with 0.33 g. KMnO<sub>4</sub>, the mixt. heated 8 hrs. with stirring, the filtered soln. evapd. in vacuo, and the mixt. extd. with Me<sub>2</sub>CO gave *K-cyclopentylidene-D-mannoside* (VI), m. 238° (decomp.), [α]<sub>D</sub><sup>25</sup> -23.9° (c 2.66, H<sub>2</sub>O). VI in a mixt. of H<sub>2</sub>O treated with an equiv. amt. of 0.6N H<sub>2</sub>SO<sub>4</sub>, the soln. extd. with Et<sub>2</sub>O, and the ext. evapd. gave *dicyclopentylidene-D-mannonic acid lactone*, m. 129°, [α]<sub>D</sub><sup>25</sup> 25.88° (c 1.22, CHCl<sub>3</sub>). ZnCl<sub>2</sub> (6 g.), 1 g. P<sub>2</sub>O<sub>5</sub>, and 2 g. 80% H<sub>3</sub>PO<sub>4</sub>, stirred

V. M. Mićović and A. Šljiviškić

24 hrs. with 8 g. D-glucose in 100 ml. I, the mixt. neutralised with  $K_2CO_3$ , the filtered soln. and the  $Et_2O$  washings neutralized with more  $K_2CO_3$ , the soln. distd., and the oily residue treated with alc. and ligroine gave 0.3 g. cryst. product, recrystd. (ligroine-alc.) to give dicyclohexylidene-D-glucose, m. 104°. The corresponding dicyclohexylidene-D-glucose and monocyclohexylidene-D-glucose (VII) were prep'd. according to Hockett, et al. (C.A. 44, 83318). Pb(OAc)<sub>4</sub> (13.4 g.) refluxed in dry  $CH_2Cl_2$  with stirring while treated dropwise with 8 g. VII in 200 ml. dry  $CH_2Cl_2$ , the mixt. heated 30 min. at 100°, the filtered soln. evapd., and the oily residue triturated with  $H_2O$  yielded 71% 1,2-monocyclohexylideneetrioxylidenealdehyde, m. 178° (80% alc.); semicarbazone, m. 215° (decomp.). I (28 g.), 3 g. D-fructose, and 1 ml. concd.  $H_2SO_4$  stirred 40 hrs. at room temp., the mixt. neutralized and poured into  $H_2O$ , the soln. extd. with  $Et_2O$ , the dicyclohexylidene-D-fructose (2 g.) treated with 1.5 g.  $\beta$ -Me<sub>2</sub>C(CH<sub>2</sub>)<sub>2</sub>SO<sub>2</sub>Cl, and the product recrystd. (80% alc.) yielded 80%  $\beta$ -d-fructofuranose, m. 110°. Similarly 2 g. D-fructose and 10 g. II stirred with concd.  $H_2SO_4$  at room temp. and worked up yielded 62% dicyclohexylidene-D-fructose, m. 142° (80% alc.). In the condensation reactions with polyhydroxy compds. I and II behaved similarly to Me<sub>2</sub>CO with production of 5-membered ring compds. II reacted more readily than I in accordance with the 1-strain theory and the proposed generalization for the exo and endo double bonds in 5- and 6-membered ring systems (cf. Brown, et al., C.A. 49, 29804).

"Postoperative Psychosis."

Belgrade, Acta Chirurgica Jugoslavica, Vol. 11(1), No. 3-4, 1928, 15  
229-236.

Abstract [French summary modified]. Review of literature, discussion  
and own data. Of 13 patients seen in 10 years, 11 had had no previous  
contact with physicians or modern medicine, despite advanced age (up  
to 73). Most were women with extremely limited education and income.  
Authors feel that postoperative psychosis are more like hysterical  
reactions than like postpartal ones; main cause is low intellectual  
level coupled with psychoneotional instability. No Yugoslav and 7  
Western references.

"The Problem of Cancerophobia in Clinical Practice."

Belgrade, Srpski Arhiv za Celokupno Lekarstvo, Vol 91, No 1, 1963; pp 57-62.

Abstract [English summary modified]: Brief discussion of 17 patients: age, sex and occupations; severity; causes were mostly iatrogenic. Men concentrate on oral-cutaneous regions, women on breast and uterus. Several suicidal attempts. Sedative treatment was required. Too much stress on cancer education can instill too much of a holy fear of cancer especially in emotionally labile, poorly educated persons. Six Western and 3 Yugoslav references.

AUTHOR: Polaksic, Joko (Doctor); Milovanovic, Dimitrije (Doctor);  
Stojiljkovic, Srboljub (Docent, Doctor)

TITLE: Problem of psychosis in pregnant, puerperal and lactating patients in  
clinical practice

SOURCE: Medicinski glasnik, no. 12, 1964, 426-429

TOPIC TAGS: psychology, clinical medicine, obstetrics, psychoneurotic disorder

ABSTRACT: Data on 115 patients with psychosis during pregnancy and puerperium  
treated in the authors' establishment during the past 10 years, including 5  
psychoses during pregnancy, 92 during the puerperium and 18 during the  
lactation period. The clinical types, the course of the disease and the  
treatment is detailed. In general, the treatment was very successful except  
for the 9 schizophrenoid psychoses, all of whom took a chronic course  
despite classical treatment with insulin and electric shock. Authors  
suggest that somatic cause such as infection or similar cause is the most  
frequent one in cases of psychosis in pregnancy and the puerperium.

Determination of cobalt with the rotating mercury electrode. Panta S. Tulumbe and Thimka Stoikova (University of Sofia). Anal. Chem. Acta 12, 169 (1955) (in German).  
~~Underwood~~ (partial summary).—A rotating Hg electrode is described which permits quant. deposition of about 27-210 mg. of Co in 40-70 min. The cathode consists of 16-25 g. of Hg, and the electrolyte is 10-15 ml. of soln. contg. 0.1 ml. of concd.  $\text{H}_2\text{SO}_4$ . The optimal current strength is 2 amp. The anode is Pt. The Co amalgam is shiny and homogeneous, and is easily washed and dried with acetone. It is gradually oxidized by air, so that after standing several hrs., a fine powder of Co oxide sepns.

Dyes and Textile Chemistry

The synthesis of organic dyes. János Bucht, Zora Gabrielová, Mária Pogorelská, Vladimír Černý, Iva Štaklová, Mihály Závod, Gajko Zupan, and Vlado Zupan (Inst. of Text. Reseach, Lublin). *Acta. Zbrojovky* 1951, 128-30.

The synthesis of many dyes used in the textile and other industries is discussed. Brief descriptions of the synthesis are given for the following dyes: (1) sulfate black; benzene is chlorinated to produce monochlorobenzene which is then nitrated to produce 1-chloro-2,4-dinitrobenzene. This is converted to 2,4-dinitrophenol by heating with NaOH. The 2,4-dinitrophenol is heated with a soln. of polysulfide and the product, upon oxidation in air, gives the sulfate black dye. This method has been used on a semi-industrial scale to produce 10-ton amts. of the dye. (2) Sulfate blue; chlorobenzene is nitrated to give a mixt. of  $\alpha$ - and  $\beta$ -nitrochlorobenzene. The latter is treated with NaOH soln. in an autoclave at 0-7 atm. pressure to give nitrophenol. This is reduced in the presence of Fe in a salt (NaCl) soln. to give  $\beta$ -aminophenol which is condensed with 1-chloro-2,4-dinitrobenzene to give 2,4-dinitro-4'-hydroxydiphenylamine. Heating this product with a soln. of Na<sub>2</sub>S in various concns. and under different conditions followed by oxidation gives 2 blue dyes of different identity. (3) Sulfate brown; naphthalene is nitrated to give mononitronaphthalene which is further nitrated to produce a mixt. of 1, $\delta$ - and 1, $\delta$ -dinitronaphthalene which is then heated in a rotating Fe drum with Na<sub>2</sub>S and S to produce the dye. (4) Hydron Olive dye; anthracene is heated in a rotating drum with S. The product is extd. with Na<sub>2</sub>S to produce the dye. (5) Chrome blue and chrome black for wool; a soln. of 2-naphthol is treated with a soln. of
